Ideally suited to help with a smooth shift handover

Shift Vision is a software system for operators and others to keep an electronic record of what happens during a shift.

This Operations Logbook streamlines the communication process of event registration and shift handovers to creation of daily, weekly and monthly reports. The Operations Logbook is ideally suited to help with a smooth shift handover, and to enable an operations department to coordinate its own activities. A better record of what actually occurred on shift helps process plants run more effectively, reduces errors, and improves their effectiveness.

Operations Logbook helps operators, shift supervisors, planners, and plant engineers work together to operate the plant reliably.

Getting the right information at the right time to make the right decision is important, and requires that data be easily accessible. Operations Logbook provides operations staff with a common window to access information related to plant operations. Information from different sources is brought together to provide a consistent, up to date window into key operating data, problems, operating plans, the shift log and more.

Shift Handovers

Quick Features overview

- Provides a way to create shift summary reports for key operating positions at the end of every shift to help with shift handover.
- Shift Vision provides multiple logbooks. Besides an operations logbook a maintenance or lab logbook can be added.
- Provides comments and observations that were recorded throughout the day or during the last shift.
- Provides easy creation and administration for the installation tree structure (Example: Installation, System, equipment)
- Fully integrated with all eVision software. Container software and permit software are by default tied into the system for better overall overview.
- Provides standard reports, with the ability to customize the reports, for daily, weekly and monthly reporting
- Provides predefined events for common and/or repeating tasks
- Provides comments and observations that were recorded about a topic, such as environmental issues for a particular unit.
- Provides a common "to do" list for the operating department, showing scheduled and ad hoc tasks, who is responsible, and the status.
- Indicates tasks that need to be completed, and identifies the responsible party.
- Indicates whether planned tasks get done, and if not, which tasks should be reassigned.
- Provides a framework to display events, activities, and comments that occurred during a shift, which provides information to other operating teams, engineers, and management.
- Provides advanced search capabilities for finding any report, shift handover or item in the event log
